

■ Krishi Bazar — What's Left To Do

Ranked by priority · Complete in order · Deploy fast

You've built the core of a complete MERN e-commerce app. This document lists everything remaining, ranked from most critical to nice-to-have. Focus on the top items first — you can cold mail companies once Priority 1 and 2 are done.

■ Priority Overview

Priority	Category	Est. Time	Why
1	Notification System	2-3 hrs	Replaces all console.log — users need feedback
2	Error messages on forms	1 hr	Login/register silently fails without this
3	NotFoundPage	15 min	Basic professionalism
4	Redirect logged-in users	30 min	Auth pages should not show if already signed in
5	Footer sticky at bottom	30 min	Visual polish
6	Loading states	1-2 hrs	Empty screen during API calls looks broken
7	CSS polish & responsive	3-4 hrs	Mobile users exist
8	Order history page	2-3 hrs	Users need to see past orders
9	Deploy	2-3 hrs	Nothing matters until it's live
10	README + screenshots	1 hr	Recruiters look at this first
11	Kishan dashboard	1-2 days	Impressive but not blocking deployment
12	Toast refinement	1 hr	After notification system works

■ PRIORITY 1 — Notification System (Do This First)

You designed this yourself — build it. Replaces every console.log with real user feedback.

#	Task	File
1	Create NotificationContext with state: { message, type, visible } and notify(message, type) function with auto-hide setTimeout	context/NotificationContext.jsx
2	Create useNotification custom hook	hooks/useNotification.js
3	Build Notification.jsx component — fixed position top center, green for success, red for error, auto-disappears after 3s	components/Notification.jsx
4	Wrap app with NotificationProvider in main.jsx	main.jsx
5	Add <Notification /> inside Layout component	App.jsx
6	Replace all console.log success/error with notify() calls in LoginPage, RegisterPage, CartContext, CheckoutPage	All pages

■ PRIORITY 2 — Error Messages on Forms

Right now login and register fail silently. Users have no idea what went wrong.

#	Task	File
1	Add error state to LoginPage — show message below form on failed login	pages/LoginPage.jsx
2	Add error state to RegisterPage — show message on failed register	pages/RegisterPage.jsx
3	Add field validation messages — empty fields, short password, invalid email	Both auth pages
4	Add error display to CheckoutPage — show if order fails	pages/CheckoutPage.jsx

■ PRIORITY 3 & 4 — NotFoundPage + Auth Redirect

#	Task	File
1	Build NotFoundPage — big 404, short message, Go Home button	pages/NotFoundPage.jsx
2	In LoginPage — if signedIn, navigate('/') immediately	pages/LoginPage.jsx
3	In RegisterPage — if signedIn, navigate('/') immediately	pages/RegisterPage.jsx

■ PRIORITY 5 & 6 — Footer + Loading States

#	Task	File
1	Footer sticky — use min-height: 100vh on root layout so footer pushes to bottom on short pages	index.css / App.jsx
2	Add isLoading state to HomePage — show Loader component while products are being fetched	pages/HomePage.jsx
3	Add isLoading state to ProductPage — show Loader while product details are loading	pages/ProductPage.jsx
4	Add isLoading state to CartPage — show Loader while cart fetches	pages/CartPage.jsx
5	Build Loader.jsx component — centered spinner	components/Loader.jsx
6	Show empty state on HomePage when search returns no products	pages/HomePage.jsx

■ PRIORITY 7 — CSS Polish & Responsive

#	Task
1	Navbar — hamburger menu on mobile, hide links below 768px
2	HomePage — product grid 1 column on mobile, 2 on tablet, 4 on desktop
3	ProductPage — stack image and details vertically on mobile
4	CartPage — stack cart items and order summary vertically on mobile
5	CheckoutPage — full width form on mobile
6	Auth pages — card takes full width on small screens with padding
7	Test everything at 375px width in browser devtools

■ PRIORITY 8 — Order History Page

#	Task	File
1	Create GET /api/orders route — fetch all orders for logged in user	backend/routes/orderRoutes.js
2	Create getOrders controller	backend/controllers/orderController.js
3	Create OrdersPage.jsx — list all past orders with items, total, date, status	pages/OrdersPage.jsx
4	Add /orders route to App.jsx — protected	App.jsx
5	Add Orders link to Navbar when signed in	components/Navbar.jsx

■ PRIORITY 9 — Deploy (This Is When You Start Cold Mailing)

#	Task	Where
1	Create MongoDB Atlas cluster, whitelist 0.0.0.0/0, copy connection string	mongodb.com
2	Push backend to GitHub, create Web Service on Render, set MONGO_URI + JWT_SECRET env vars	render.com
3	Update frontend .env VITE_API_URL to Render backend URL	.env
4	Push frontend to GitHub, import on Vercel, set VITE_API_URL env var	vercel.com
5	Run seed data on production database	node seed/seedProducts.js
6	Test full flow on live site — register, login, add to cart, checkout	Live site
7	Fix the Render cold start — add loading message to frontend so recruiters don't think the site is broken	Frontend

■ PRIORITY 10 — README + Screenshots

#	Task
1	Take screenshots of: HomePage, ProductPage, CartPage, CheckoutPage, Login
2	Add screenshots to README under a Screenshots section
3	Add live demo link at the top of README
4	Update Getting Started with production env vars
5	Add API endpoints table to README

■ PRIORITY 11 & 12 — After Deployment (Nice to Have)

#	Task	Priority
1	Kishan Dashboard — sales stats, manage products, order management	After deploy
2	Recently viewed products — store last 5 visited in localStorage	After deploy
3	Wishlist feature — save products for later	After deploy
4	Search bar in Navbar — global search across site	After deploy
5	Product image upload with Cloudinary	After deploy
6	Email notification on order placed with Nodemailer	After deploy

■ When Can You Start Cold Mailing?

Requirement	Done?
Priority 1 — Notification system	☒
Priority 2 — Error messages on forms	☒
Priority 3 — NotFoundPage	☒
Priority 4 — Auth redirect	☒
Priority 9 — Deployed with live link	☒
Priority 10 — README with screenshots and live link	☒

Once all 6 boxes above are ticked — start cold mailing. Don't wait for perfect. Priorities 5–12 can be done while applications are out.

■ You've built something real. Now finish it and ship it.
